

TASK 7 — Reports and Logs

1. Experiment Title

Reports and Logs Using Robot Framework

2. Problem Statement

Create a Robot Framework test case that performs a web login operation and uses the Log keyword to record custom messages during test execution. Generate and examine the HTML reports and logs produced by Robot Framework.

3. Objective

- To generate test execution reports using Robot Framework.
- To generate detailed execution logs.
- To use the Log keyword for custom messages.
- To understand the automatically generated report.html, log.html, and output.xml files.

4. Tools, Software and Concepts Used

Tools & Software

- Python
- Robot Framework
- SeleniumLibrary
- Selenium WebDriver
- Google Chrome
- VS Code

Concepts Used

- Robot Framework Test Cases
- Selenium Web Automation
- Log keyword
- HTML Reports

- Execution Logs
- output.xml
- report.html
- log.html
- Verification and Assertions

5. Source Code / Implementation Steps

File Name

assignment7.robot

Source Code

*** Settings ***

Library SeleniumLibrary

*** Test Cases ***

Verify Login With Logs

Log Starting the login test

Open Browser <https://www.saucedemo.com/> Chrome

Log Entering username

Input Text id=user-name standard_user

Log Entering password

Input Text id=password secret_sauce

Log Clicking login button

Click Button id=login-button

Log Verifying successful login

Location Should Contain inventory.html

Log Login test completed successfully

Close Browser

Execution

Navigate to the Task 7 folder:

```
cd "C:\Users\Rishita Saha\Desktop\SELENIUM ASSIGNMENTS\ROBOT  
FRAMEWORK ASSIGNMENTS\Assignment_7_Reports_Logs"
```

Run:

```
robot assignment7.robot
```

Robot Framework automatically generates:

output.xml

log.html

report.html

6. Output with Clearly Labelled Screenshots

Include these screenshots in the workbook:

Successful Test Execution

Show the terminal after running:

robot assignment7.robot

The execution should show:

1 test, 1 passed, 0 failed

7. Result

The login test was successfully executed using Robot Framework. Custom messages were recorded using the Log keyword, and Robot Framework generated the **HTML report, detailed log, and XML output file** automatically.

8. Observation

- The Log keyword helps record meaningful messages during test execution.
- report.html provides a summary of the test execution.
- log.html provides detailed execution information.

- output.xml stores the execution results in XML format.
- Robot Framework automatically generates these files after execution.

9. Conclusion

This experiment demonstrated **report generation and logging in Robot Framework**. Custom log messages can be used to make test execution easier to understand, while the automatically generated HTML reports and logs provide useful information for analyzing test results.
